

Security Tips

Introduction

It's too bad that we have to resort to some of the steps outlined below but in today's world we can't take too many precautions. You can choose to take all or none of these steps but at least you know about them.

Here's what I've done recently:

- Purchased a Yubikey for 2-Step verification with LastPass
- Switched, finally, to credit cards that are chip enabled
- Checked my Gmail alternate contact methods
- Turned on 2-Step verification with our Gmail accounts
- Enabled fingerprint access for mobile devices (not unbreakable but better than nothing)
- Turned off Simple Passcode in iPad and iPhone to allow longer passwords including characters
- Reviewed a Credit Report from Experian (does not include FICO Score)
- Check your password strength at <https://www.grc.com/haystack.htm>
- Placed all of my passwords on a flash drive and put it in a secure location (safe or safety deposit box or store it offsite). You can export from Lastpass but not from RoboForm. From RoboForm, click Logins, Print List.
- Updated my software with PatchMyPc
- I'm thinking about MFA with Amazon (Multi Factor Authentication – can use mobile phone)

This is no guarantee that I'm totally save but I'm at least better off.

Finally – I'm not trying to represent myself as a security expert but merely attempting to provide the information resulting from my several hours of research and many more hours of experience.

Gmail

2-Step Verification

Under Signing in you can enable 2-Step Verification by click on it as shown below.

Signing in

Password Last changed: Jan 20, 2013

Recovery email covteacher1@yahoo.com

Recovery phone (949) 374-4845

Secret question "Dog's name"

2-Step Verification On since: Dec 22

App passwords 2 passwords

Your first screen will look like the one below. Click Start setup.

Signing in with 2-step verification

Signing in will be different

You'll need verification codes:
After entering your password, you'll enter a code that you'll get via text, voice call, or our mobile app.

Keep it simple

Once per computer, or every time:
During sign in, you can tell us not to ask for a code again on that *particular* computer.

Help keep others out

You'll still be covered:
We'll ask for codes when you (or anyone else) tries to sign in to your account *from other computers*.

2-step verification

Keep the bad guys out of your account by using both your password *and* your phone.

[Start setup »](#)

[Learn more](#)

The next screen will ask you to send a code to your cell phone. Just click Send code.

Set up your phone

1 — 2 — 3 — 4

Which phone should we send codes to?

Google will send a numeric code to your phone whenever you sign in from an untrusted computer or device.

Phone number ex: (201) 555-5555

 (949) 374-4845 

- You provided this number for [account security](#) on Jul 8, 2014.
- Google will only use this number for account security.
- Message and data rates may apply.

How should we send you codes?

Text message (SMS)

Voice Call

[« Back](#) [Send code](#)

The next screen will ask you to confirm.

1 — 2 — 3 — **4 Confirm**

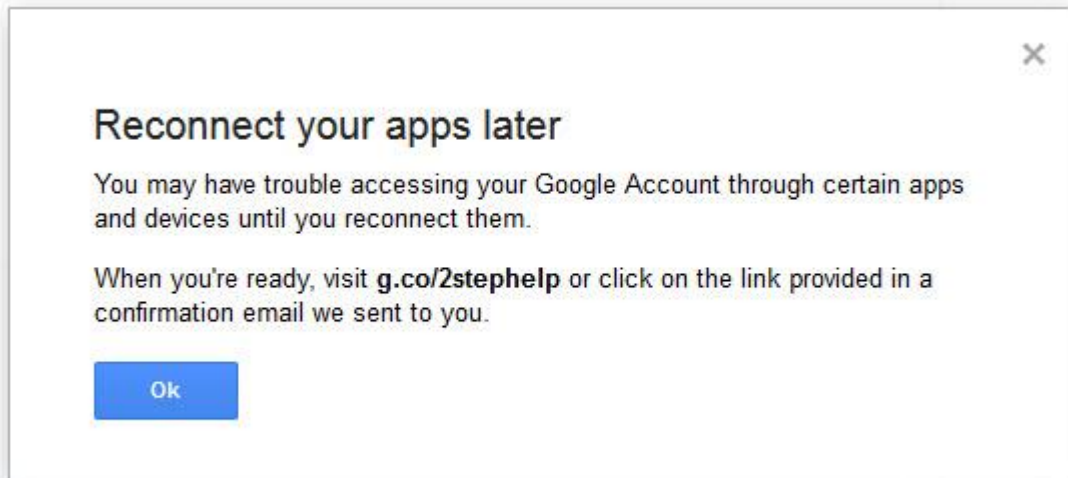

Turn on 2-step verification

You'll only be asked for a code whenever you sign in using your **lindans3739@gmail.com** account from an untrusted computer or device.

If you lose your phone, you can always change it in account settings.

[« Back](#) [Confirm](#)

The next screen will ask you to Reconnect your mobile apps which you can choose to do later.

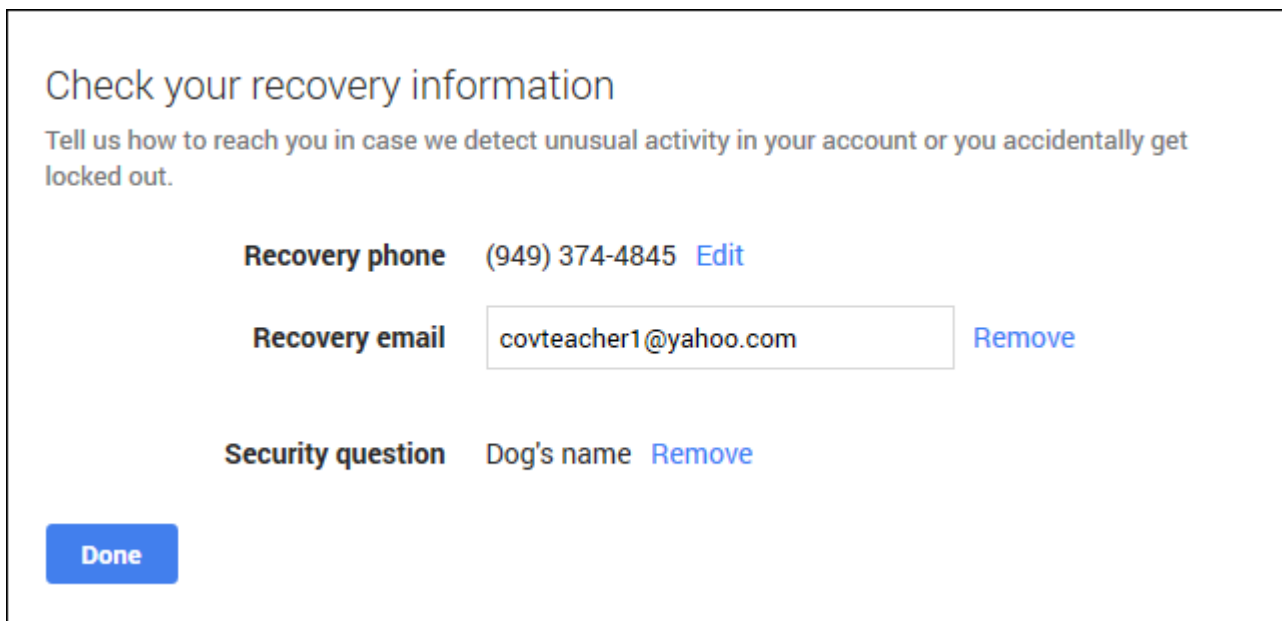

Somewhere along the line you will be given the choice to trust the PC that you are working on. This means that codes will not be required for your desktop PC or laptop.

Security check

Check your security at security.google.com or myaccount.google.com. If you are not logged in you will be given the opportunity to do so.

From here you have several options but the main one is Security check up. Click Get Started and log in once more and start your way down through the various settings, you can't skip around

Check your 2-Step Verification settings

Please make sure that all your 2-Step Verification settings are up to date. [Learn more.](#)

Verify by

Text message to (949) 374-4845

Backup options	Added on	Details
Backup phone	Dec 22	(949) 305-2962
Backup codes	Dec 22	10 codes left

You can see that I've enabled 2-Step verification which I recommend. Here are some tips:

- You must have a cell phone or land line listed where the codes will be sent
- You can also list a secondary email address
- You can identify your desktop PC or laptop as safe devices and 2-Step Verification will not be required
- For mobile devices you will need to visit the App-specific passwords tab and click Manage application-specific passwords to generate passwords for these devices.

2-Step Verification

Verification codes

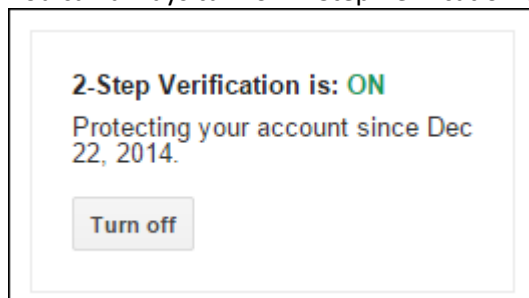

App-specific passwords

Registered computers

Security Keys

- You can also print out a list of Backup codes for use in an emergency. Let's assume you are out of the country and can't use your phone to receive a text message with your 4-digit access code, You can use these codes instead. There good fore 1 time access but you get 10 of them. You can also generate new ones if you run out.
- You can manage Registered computers as shown above. This means that you can Require codes on PCs that were previously tagged as safe.
- Security Keys only work with Google Chrome. I haven't tried this feature since you need a special device. A YubiKey will work but is a different one then the one I use with LastPass. You can get one [here](#) for \$17.99 on Amazon. Remember – this only works with Google Chrome. You can read about a Security Key [here](#).

- You can always turn off 2-Step Verification by going to the right of Security Keys as shown below.

Google Location History

How to access it. Go to maps.google.com/locationhistory or click [here](#).

- Location History and Location Reporting data may be used by any Google app or service, including in ads on and off Google. For example, Google Maps may use it to improve your search results based on the places that you've been.
- **Location Reporting:** Allows Google to periodically store and use your device's most recent location data, as well as activities like driving, walking, and biking, in connection with your Google Account.
- **Location History:** Allows Google to store a history of your location data from all devices where you are logged into your Google Account and have enabled Location Reporting. You can turn off Location History at any point, but doing so won't delete your Location History. It also will not turn off Location Reporting, GPS, or Wi-Fi location services for your device.
- iPhone – go to Settings, Privacy, Location Services
- Turn Location Reporting on or off using Google Settings
 - Open Google Settings from your device's apps menu.
 - Devices running Android 4.3 or lower: Touch Location > Location Reporting.
 - Devices running Android 4.4: Touch Account History > Google Location History > Location Reporting.
 - Slide the switch ON or OFF.
 - For Android 2.3-3.0 devices, check the box next to "Location Reporting."
 - Turn Location Reporting on or off using the Location menu in Google Settings
 - This setting is available on devices running Android 4.4.
 - Open Google Settings from your device's apps menu.
 - Touch Location > Google Location Reporting > Location Reporting.
 - Slide the switch ON or OFF.

Here's a sample from my Location History. You can tell that I was in San Juan on that day.

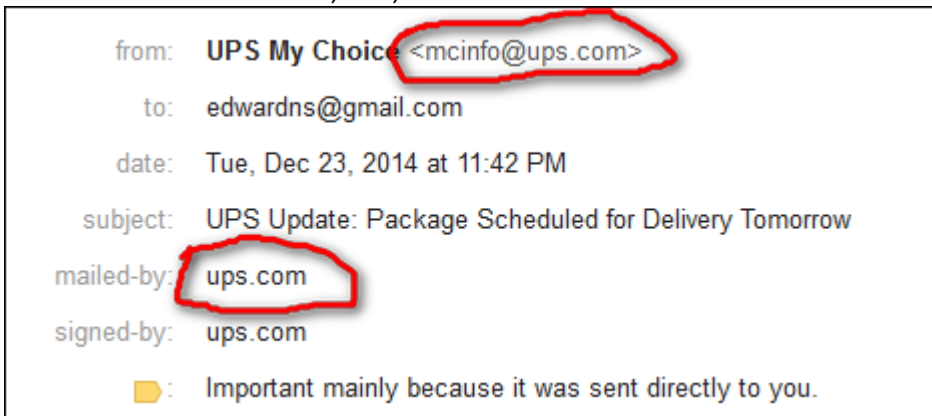

Use the Show Details feature in emails

When you receive an email it's not always from who you think it is. To see who the sender really is, especially if you are suspicious, click the little arrow as shown below.

This reveals the real sender, UPS, as shown below.

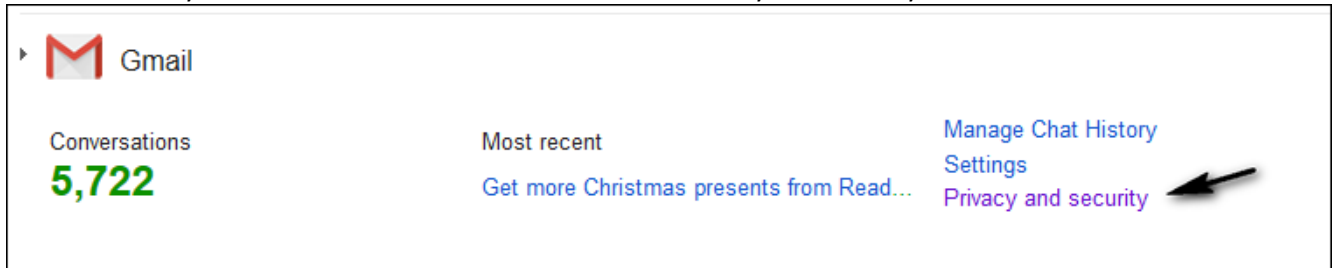

Google Safety Center

Go to google.com/safetycenter or click [here](#). We will explore this site in class. This site is mostly about educating you so you can be more secure or in some cases browse without leaving a trail.

Google Dashboard

This is not so much about security but it's worth a visit nonetheless. You can visit it at google.com/settings/dashboard or click [here](#). We will review it in class.

As a minimum you should scroll down to Gmail and click Privacy and security as shown below.

Check out the links there, some are very informative, especially the Security Checklist.

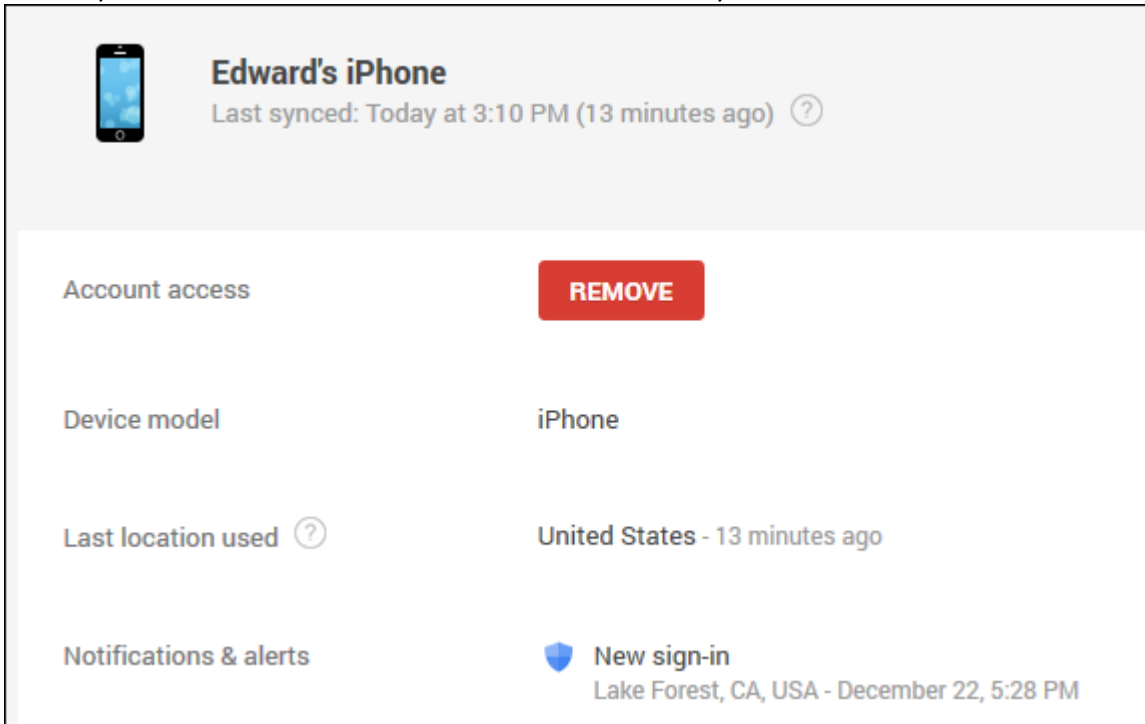

Check your Devices and Activities

Go to security.google.com/settings/security/activity or click [here](#). Look for any suspicious activity.

Here's my recent activities.

 Windows	Lake Forest, CA, USA CURRENT DEVICE

Using Java

Why is Java a security risk?

- It is exploitable by hackers
- Users do not patch it regularly

Find out if you have Java installed by going to <http://www.java.com/en/download/installed.jsp>

Here's my status below with no Java on my PC or with it disabled in my browsers.

 **Java is disabled or not installed**

- » [Enable Java through the Java Control Panel](#)
- » [Download Java](#)
- » [See troubleshooting tips](#)

Here's the message that I received during the Java installation since I have Java disabled in my browsers.

Java Setup - Browser Plug-in Disabled

 ORACLE

Java content is disabled in web browsers

To enable, select 'Enable Java content in the browser' on the Security tab of the Java Control Panel.

Next >

Here's the status of my Java after allowing it in my browsers.

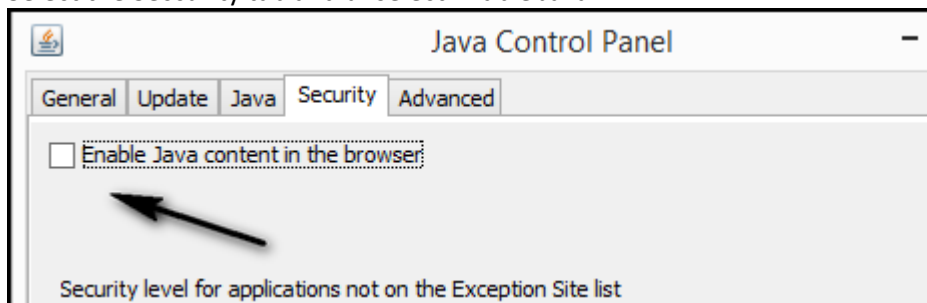

How do you know if you need Java? One way to find out if you need it is to remove it and determine what you can no longer do.

- My recommendations – uninstall it if you don't need it.
- As a minimum, disable it in your browsers as follows
 - Open the Control Panel and click Java (32-bit)

- Select the Security tab and unselect Enable Java

Mobile devices

- Make sure you have passcode and fingerprint sensing turned on

Resources

- For Identity Theft - read the information [here](#) and [here](#).
